Windows Vista is the name of the next version of Microsoft Windows. It includes a new "user experience" called Aero. Part of that experience is a new "glassy" user interface.

StyleVista is a simple program that lets users alter that new user interface. Users can set the color and opacity of the foreground window and the background window. Future

builds will include even more features. Stay tuned! Fibromyalgia syndrome (FMS) is a

chronic disorder of unknown etiology characterized by the presence of widespread

musculoskeletal pain and tenderness (tender point) in the absence of any detectable

organic disease. Clinical features include fatigue, sleep disturbances, poor quality of

life, and frequent comorbidity with other musculoskeletal conditions. FMS is often

misunderstood by both patients and physicians. It is often thought that FMS is a

fictional disease or a hoax, in spite of the fact that the American College of

Rheumatology (ACR) and the World Health Organization (WHO) have classified FMS

as a real disease. In addition, FMS is neither rare nor rarer than is commonly believed,

for often only 30% to 50% of individuals with FMS have painful trigger points or

widespread musculoskeletal pain, and it has been estimated that up to a quarter of the

population may have it. FMS is a clinical diagnosis that includes the presence of the

specific symptoms as well as the supportive subjective complaints of the patient.

Features must meet current ACR criteria for the diagnosis of FMS. Additional support

for the diagnosis of FMS may be obtained with the help of appropriate laboratory tests,

physical examination, and appropriate imaging. Although FMS often occurs in

conjunction with other medical conditions, including depression, anxiety, low-back pain, temporomandibular joint disease, tension headaches, arthralgias, and Raynaud's syndrome, the diagnosis of FMS should be confirmed by excluding a definite organic disease. The etiology of FMS is still unclear. Patients often mention an emotional or psychological source of their pain; one study reported that, in 28% of the patients, there was an antecedent trigger to the onset of FMS that had been a life crisis (Ritchie, *Ann. Rheum. Dis.*, 56:280-289, 1998). In addition, stress has been reported to increase sensitivity to pain and tenderness in patients with FMS. In a recent case study, two patients with longstanding FMS described 09e8f5149f
