

NanoPing Crack+ X64 [Updated]

The data transfer rate of an Internet connection or Internet gateway. **Help:** The application displays basic ping information, such as the IP address, the connected IP address, the connected host, the host's network mask, the connected and host's protocol version, and the time interval between pings. It displays all this information in a graph format. **DNS queries:** Reports the total number of queries, cache misses, and cache hits in an assigned interval. **Pings:** Reports the number of pings, total time, success, loss, and idle time. **Tcp options:** Displays the TCP window size, the TCP queue length, and the TCP congestion window. **What's New in Version 1.0.0.0:** Fixed the bug that caused the program to display an error in certain cases. Changes in Windows XP/Vista/7/8 The installer has been modified to include the needed.NET Framework installation. NanoPing - Ebook Authoring Software NanoPing is a great alternative to the default Windows ping command utility. Featuring a simple-to-grasp graphical user interface, it makes it easy for users to view and save ping log files, as well as change different settings. You can install it on all Windows versions. Microsoft.NET Framework 2.0 is needed in order to run the application without having to experience bugs and errors. Simple GUI Default Windows ping commands are resumed to a command-prompt mode that gives users the actual ping when connected to a certain server. With Nano Ping, however, users have a more approachable layout of options where they can see detailed information rather than just basic ping options. They can check out the server ping interval in real time, buffer size, and on request even the timestamps between intervals. Minimal features There's hardly any other feature that you'd require from a program that gives you the ping interval in real-time, and NanoPing offers users some little extra data about their connection. Besides the server and website target, users can manually change the buffer size from 32 bytes to whatever bandwidth number they want to introduce, alter the ping time interval, and they can even set the app to alert users either on connection success or failure. Logs can be saved as well when users plan to monitor a certain server during high traffic periods, and sent to parties interested in TXT format. Timestamps can also be introduced so users can have an accurate

What's New in the?

Use a cluster of virtual machines as a proxy for your site to avoid downtime. nanoPing is a powerful, networked ping utility with a graphical user interface, for monitoring the latency and packet loss between two hosts on your network. **Key Features:** Graphical interface: all common ping commands are accessible from one window. Remote host is available: even in a disconnected state, nanoPing allows you to continue monitoring remotely. **Troubleshooting:** Users can check the status of a remote host and search for possible causes for network connection problems. Network bandwidth graph: users can monitor the network bandwidth between two hosts. Buffer: users can monitor the buffer size for a specific host. Language: users can monitor the language of a remote host. Host Name: users can monitor the host name of a specific host. Preferences: users can select the default ping interval and graph color. **Powerful features:** ultra-fast ping with a 32 byte buffer: 7 Mpps nanoPing is a powerful, networked ping utility with a graphical user interface, for monitoring the latency and packet loss between two hosts on your network. **Key Features:** Graphical interface: all common ping commands are accessible from one window. Remote host is available: even in a disconnected state, nanoPing allows you to continue monitoring remotely. **Troubleshooting:** Users can check the status of a remote host and search for possible causes for network connection problems.
