The concept of climate describes the variation of water temperature, precipitation, and humidity in the atmosphere. The climate of a specific area is used to measure how “warm” or “cold” that area is. (NCDD 146) This report includes a total of 3 tasks. The first task describes how the application of a phosphate fertilizer to grasses may reduce phosphorus runoff from agricultural land. The second task suggests that caribou spend more time on low shrubs than do moose, and that caribou feeding habits are more important than moose feeding habits in determining the success of meadow plants. This task also includes a question about how biologists can be used as a resource to small villages, and another question about whether climate change can be seen in the mammal population in northern Canada. (SRL 4) The mammal species questionnaire is a biostratigraphical tool for identification of species. The quiz questions will give you an understanding of how scientists identify species, and how their discoveries play a role in the Environmental Club. This report explains how beavers modify, build, and maintain wetland areas. It includes 2 tasks that ask the question whether beavers are a good or bad environmental factor in the wetlands of Ontario. This report also includes two tasks on the importance of wetlands, and the stresses on the environment. This report explains the link between soil erosion and soil structure. It includes the following tasks: Building soil structure and erosion. Soil structure relates to the micron size of the particles in a soil. The structure is built in the air, by water, and by organisms in the soil. It is divided into two parts: coarse and fine. The Part A section shows how to study the structure of soil. The Part B section shows how to compare different soils and their surface areas. A final question discusses whether or not we should use more water to make crops. (SRL 8) This report explains the ways that climate change is going to affect the ecosystems on the planet. It includes the following tasks: Glaciers. Glaciers are the largest bodies of ice in the world. They come and go depending on the
